I wanted to reach out to express my satisfaction with the services provided by Sirius Controls in SE Saskatchewan.

We have three of their complete systems installed throughout our fields. The systems deliver extremely accurate rates on critical injection points. Accurately meeting target injection rates allows us to forecast chemical consumption and stay on budget. It also helps and ensure the appropriate amount of chemical is being injected to prevent the formation of hydrates in a critical gas system. We have the ability to monitor all three of the systems via the Connect dashboard. This allows us to monitor inventories, check daily rates, make quick changes to target rates based on production changes and send batches to assist with pigging.

Their field services teams work well with our HSE group and field visits are compliant with our safety values and expectations. Upon setup of any new system, the field service team (Barclay) is onsite to ensure everything functions properly and provides training for the operators. The field services team (Barclay) is frequently onsite checking for issues and communicating and findings back to us.
