**RE: Recommendation**

[REDACTED] in the Drayton Valley region has used multiple different manufacturers of chemical injection systems over the years. In 2011, we began using the Sirius Chemical Injection System for our new drills. We chose the solar powered version even though we had power problems in the past with other vendors. We have had very good success with the Sirius Injection units since the switch over and have standardized our fields on the Sirius product. When service or questions arose, Sirius was astute with solutions and recommendations to ensure smooth operation.

The systems are extremely easy to use and with the addition of their new controller, they have made operation simple. In addition to the solar units we have used Sirius's AC powered Injection System that is much easier to use than anything I have come across before. The Sirius systems save us money on maintenance and on the amount of chemical we inject. We plan to test out the modbus system to automate the systems and further reduce costs associated with chemical injection.

I feel very strongly about Sirius and its people in terms of their integrity and product quality, and would recommend them to anyone. They are definitely leading edge in the chemical injection world.

Sincerely,

[REDACTED]
