Re: Recommendation

[REDACTED] has experience using electric chemical injection pumps over the last 10 years in Central and Northern Alberta locations. We have used various DC powered pumps in supplied power and solar powered applications. The pumps are usually part of a fully-electric separator package that requires no gas to operate, although a few have been stand-alone pump systems.

We have always found the Sirius pumps to be the most robust and trouble-free. We find customers to be overall happy and satisfied with the pumps we supply, which helps our company look after our valued customers.

In particular the newer Comet pumps are impressive in performance and efficiency. This is critical in our solar applications as well as for operator friendliness and much reduced maintenance. Sirius has done a fine job in product development to get to this point, and we are proud to pass this benefit on to our customers. Again, pump performance and efficiency is critical to our company's bottom line, and we count on Sirius products to enable us to give great customer service.

Sincerely,

[REDACTED]
