

DIGITIZE YOUR FIELD

Introducing cruise control for any chemical pump!

Introducing, CRUISE...A universal pump control and monitoring system that can be installed or retrofitted on any chemical pump (solar, AC, and pneumatic). CRUISE is the ideal choice for operators ready to automate their fields as quickly and efficiently as possible.

CRUISE is installed using the provided mounting kit and by following the intuitive setup wizard...a simple step-by-step on board configuration which requires minimal input and uses an exclusive, automated, self-calibration routine. When ready, simply dial in the required rate and walk away.

CRUISE runs autonomously to maintain accurate injection rates and further provides tank fluid level readings, flow totalizers, system alarms and more.

Accuracy is maintained independent of

- Fluid density
- Process pressure
- Viscosity changes
- Battery voltage changes
- Pump mechanical wear
- Operators overtightening packing

Digital operator
ON-SITE 24/7!

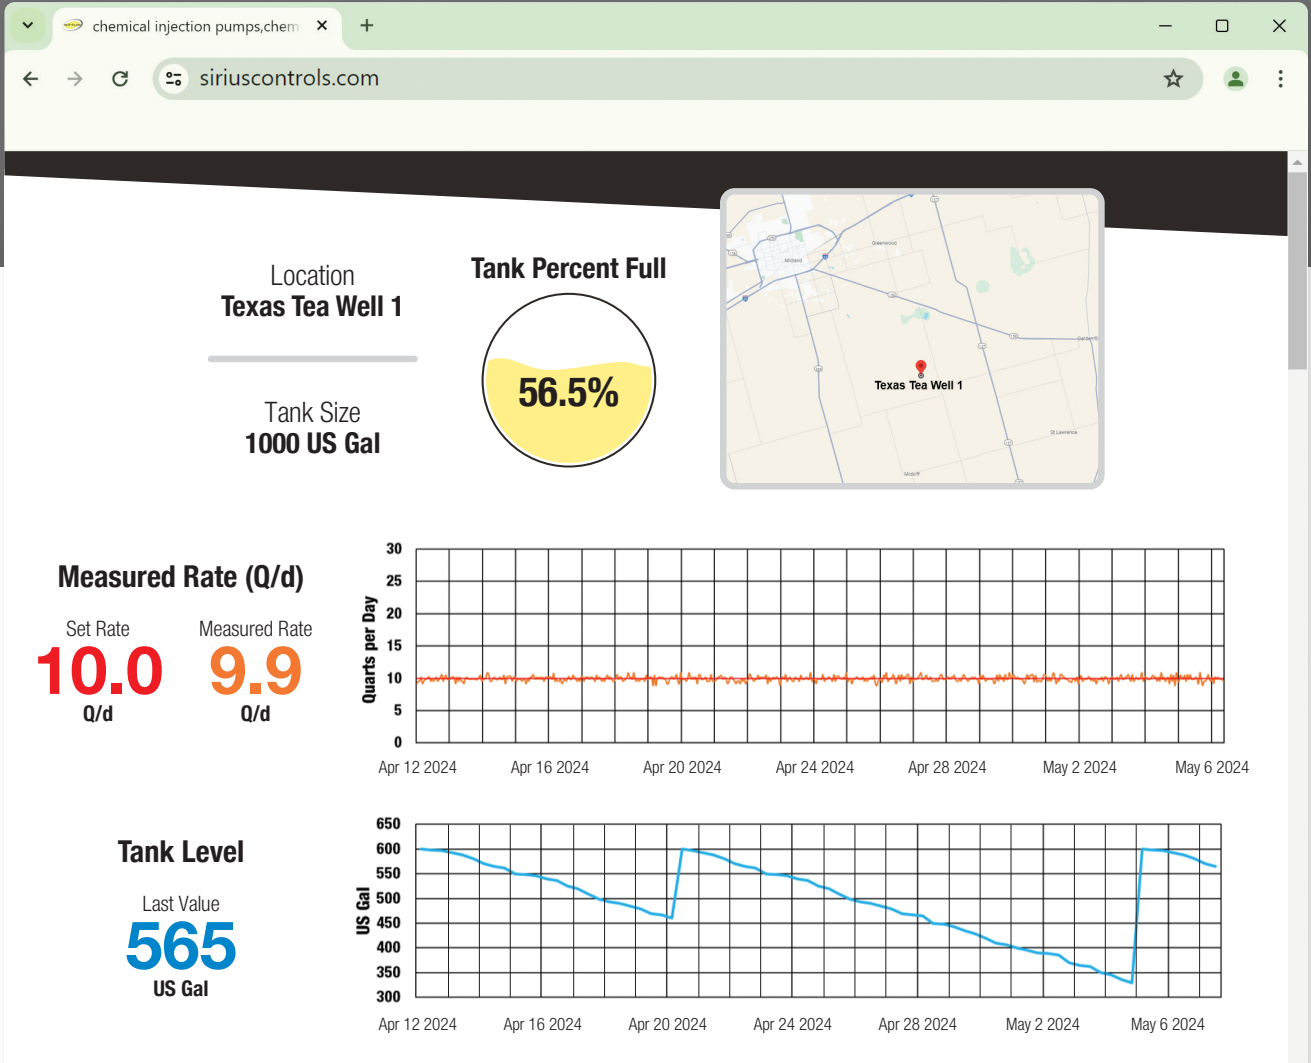

Connect for ... **CRUISE**

When CRUISE is combined with remote monitoring such as Sirius Connect cellular IIOT platform or SCADA, operators can now truly manage by exception: Chemical deliveries can be scheduled only when required, personnel are deployed to site only when problems occur, and chemical is always injected at the desired rates, improving the performance and safety of the chemical program.

Make managing by exception a part of your bottom line. Get Sirius about digitizing your assets with CRUISE.

^Engineered to provide superior reliability, reduce electrical noise and simplify installation.
